ROLL NO : 257Y1D5805

YEAR : I Year II Semester

ACADEMIC YEAR : 2025 - 2026

What is Robotic Process Automation?

Robotic Process Automation (RPA) is a technology that uses software robots ('bots') to automate repetitive, rules-based digital tasks by mimicking human interactions with user interfaces.

Core Concepts & Benefits

- **Mimics Humans:** Interacts with applications, clicks buttons, types text, and copies files just like a human operator.
- **Rules-Based:** Follows predefined execution paths (if-else logic, loops) without needing human decision-making.
- **Zero Integration Cost:** Works on the user interface layer (UI), requiring no modifications to legacy backend databases or APIs.
- **Speed and Accuracy:** Executes tasks 24/7 with zero typographical errors, minimizing business costs.

Primary Industry Use Cases

- **Finance & Accounting:** Invoice processing, bank reconciliations, tax reports extraction, account audits.
- **Human Resources (HR):** Employee onboarding data synchronization, payroll processing, holiday tracking updates.
- **Customer Service:** Directing customer tickets, processing basic account queries automatically, pulling chat histories.
- **Data Operations:** Moving data between legacy green-screen terminals and modern cloud databases (data entry).

Ways to Create Bots

RPA platforms (like Automation Anywhere) offer three primary methods to construct bots:

1. Screen Recording

- Action: Logs keyboard inputs and mouse coordinates as you perform a task.
- Pros: Instantly generates bot files; needs no code.
- Cons: Brittle. Changing button positions or resolution breaks the bot.

2. Object Cloning

- Action: Captures actual UI element properties (HTML IDs, tag names, controls) rather than coordinates.
- Pros: Highly robust. Bot finds button even if moved.
- Target: Standard in web and desk apps.

3. Workflow Designers

- Action: Constructing bots by dragging and dropping command blocks (e.g. Open Browser, Query DB).
- Pros: Easy to insert loops, conditions, and custom error handling.
- Target: Complex business workflows.

Applications of Bot Creation

How enterprises implement bot creation to solve daily data bottlenecks:

Automated Invoice Extraction

A bot logs into email, downloads PDF invoices, uses OCR to extract total values, and inputs data into legacy accounting terminals.

HR Onboarding Automation

Triggers when a new hire is flagged. Bot copies data from recruiter portals and sets up logins across AD, email, and payroll systems.

Legacy System Data Sync

Acts as a bridge. The bot reads data from old mainframe screens and copies it into modern Salesforce cloud tables, keeping systems in sync.

Weekly Report Aggregator

Bot logs into multiple portals overnight, runs search queries, downloads Excel files, aggregates values, and emails reports to managers.
