ACADEMIC YEAR : 2025 - 2026

The Web Control Room

The Web Control Room (Web CR) is the centralized web-based management server in Automation Anywhere. It manages, deploys, schedules, and audits software bots across the entire enterprise network.

Core Management Features

- **Centralized Deployment:** Upload bots from developer clients to the Web CR, then push them to local runtime runners.
- **Activity Tracker:** Monitors active runs, schedules tasks, and alerts admins if a bot encounters errors.
- **Device Management:** Monitors connections of development and runtime client machines.
- **Compliance & Auditing:** Logs all admin logins, bot executions, and configuration changes to secure databases.

Dashboard Panels (Insights)

Web CR features panels to monitor operations:

- **Home:** Overall summary of system health and active runs.
- **Bots:** Library of uploaded task files (.atmx) and credential configs.
- **Devices:** Connection states of bot runner clients.
- **Workload:** Status of transaction queues and SLA counters.
- **Audit Log:** Security compliance reports tracking all user activities.

The Credential Vault

The Credential Vault is a secure database that manages credentials for bots:

Security & Encryption

- **Secure Storage:** Stores passwords, API keys, and database logins. Prevents hardcoding passwords in bot files.
- **High Encryption:** Encrypts data using AES-256 standard, keeping keys secure.
- **Role-Based Access:** Admins control which bots and users can reference specific locker values.

Runtime Variable Binding

- **Dynamic Reference:** Bots reference vault items as variables (e.g. \$Locker.Password\$).
- **Zero Plain Text Exposure:** The password is only decrypted in memory during the login step. Developers cannot see the raw password value.
- **Central Rotation:** Updating a password in the vault updates it for all bots instantly, avoiding script edits.

Applications of Web Control Room

How administrators manage bot deployments in enterprise environments:

Overnight Job Scheduling

Admins schedule invoice processing bots to run at 2:00 AM on runtime devices. Web CR automatically boots the bot and processes files.

Secure Database Credential Provisioning

Provides database access tokens to query bots via the Credential Vault. Bots run queries without developers seeing passwords.

Security Compliance Auditing

Logs every bot run (username, device, duration, success status) to the secure audit catalog, meeting regulatory compliance requirements.

API Integration

Exposes Web CR features via REST APIs. Allows external platforms (like Salesforce or ServiceNow) to trigger bots dynamically.
